## PROTECT YOUR STARCH WITH BODYGUARD

### Cob Ripeness

Well filled determinate cob with large grains. Early cob ripeness and prompt starch lay down.

Cob ripening days after Picker + 5

### Maturity Group

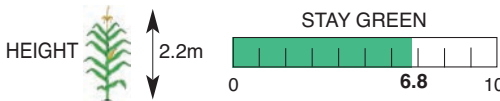

Long harvest window from a variety that has early cob ripeness from natural maturity. Plant remains greener at harvest aiding digestibility and extending the potential harvest window.

### Quality & Digestibility

Good cell wall digestibility, 57%, ensures quick digestion within the rumen allowing more feed to be consumed and more milk or meat to be produced.

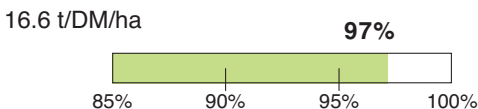

### Plant Description

Good plant with prostrate leaves, lot of leaf bulk.

Superb cob held low on plant. Stay green variety allowing increased harvest window.

### Yield

Sow at 42,500 to 45,000 seeds/acre 105,000 to 111,000 seeds/ha to maximise cob and starch content. Quality silage produced from leafy plant with cob that has early grain maturity. Robust and stable performance, suits heavy soils.
